Here is a set of practice problems to accompany the Factoring Polynomials section of the Preliminaries chapter of the notes for Paul Dawkins Algebra course at Lamar University. Algebra - Factoring Polynomials (Practice Problems) If we had only removed the factor "3" from  $3x^2 + 6xy + 9xy^2$ , the answer would be  $3(x^2 + 2xy + 3xy^2)$ . Multiplying to check, we find the answer is actually equal to the original expression. However, the factor x is still present in all terms. Hence, the expression is not completely factored. Factor a polynomial or an expression with Step-by-Step

... Algebra 1 Review Packet Page 3 Factoring Factoring (Common Monomial Factor) Solution: The first step in ANY factoring problem is to factor out the GCF. The other factor is the original polynomial divided by the GCF. A variable must be in each term of the polynomial in order to be in the GCF. Always use the smallest exponent in the GCF.
